Contributed Papers

T-3: Cyber-Infrastructure, Informatics and Intelligent Systems

Life cycle simulation for a process plant based on a two-dimensional co-simulation approach <i>Mathias Oppelt, Gerrit Wolf, Leon Urbas</i>	935
On the process of building a process systems engineering ontology using a semi-automatic construction approach <i>Canan Dombayci, Javier Farreres, Horacio Rodríguez, Edrisi Muñoz, Elisabet Capón-García, Antonio Espuña, Moisès Graells</i>	941
Graphical processing unit (GPU) accelerated solution of multi-dimensional population balances using high resolution finite volume algorithm <i>Botond Szilagyi, Zoltan K. Nagy</i>	947
Development of computer aided modelling templates for model re-use in chemical and biochemical process and product design: import and export of models <i>Marina Fedorova, Gregor Tolksdorf, Sandra Fillinger, Günter Wozny, Mauricio Sales-Cruz, Gürkan Sin, Rafiqul Gani</i>	953
BiOnto: An Ontology for biomass and biorefining technologies <i>Nikolaos Trokanas, Madeleine Bussemaker, Eirini Velliou, Hella Tokos, Franjo Cecelja</i>	959
Linking process, electrical and logical connectivity for supported fault diagnosis <i>David Dorantes Romero, Tone-Grete Graven, Nina F. Thornhill</i>	965
An interactive framework for building and analysing models of urban energy systems <i>K. Kuriyan</i>	971
Model-based analysis of waste management systems through a natural language approach <i>Vassilis Magioglou, Elisabet Capon-García, Sara Badr, Antonis Kokossis</i>	977

Enterprise-wide scheduling framework supported by knowledge management <i>Elisabet Capón-García, Edrisi Muñoz, José M. Laínez-Aguirre, Antonio España, Luis Puigjaner</i>	983
Knowledge management to support the integration of scheduling and supply chain planning using Lagrangian decomposition <i>Edrisi Muñoz, Elisabet Capón-García, Jose M. Laínez-Aguirre, Antonio España, Luis Puigjaner</i>	989
An ontological approach to integration of planning and scheduling activities in batch process industries <i>Marcela Vegetti, Gabriela Henning</i>	995
Constructing an ontology for physical-chemical processes <i>Heinz A Preisig</i>	1001
Contributed Papers	
T-4: Process and Product Synthesis-Design	
Improved design strategies for flexible hydrogen networks <i>Chuei-Tin Chang, Che-Chi Kuo</i>	1007
An integrated reactive distillation process for biodiesel production <i>Eduardo S. Perez-Cisneros, Ricardo Morales-Rodriguez, Mauricio Sales-Cruz, Tomás Viveros-García, Ricardo Lobo-Oehmichen</i>	1013
A sequential algorithm for the rigorous design of thermally coupled distillation sequences <i>José A. Caballero, Juan A. Reyes-Labarta, Ignacio E. Grossmann</i>	1019
Discovery of new zeolites for H ₂ S removal through multi-scale systems engineering <i>Tingting Liu, Eric L. First, M. M. Faruque Hasan, Christodoulos A. Floudas</i>	1025
Optimization of a fusel oil separation system using a dividing wall column <i>José de Jesús Mendoza – Pedroza, Juan Gabriel Segovia – Hernández, Álvaro Orjuela – Londoño, Salvador Hernández</i>	1031
Silane production through reactive distillation with intermediate condensers <i>J. Rafael Alcántara – Avila, Hugo Alberto Sillas – Delgado, Juan Gabriel Segovia – Hernández, Fernando I. Gómez – Castro, Jorge A. Cervantes - Jauregui</i>	1037
Optimal production of furfural and DMF from algae and switchgrass <i>Mariano Martín, Ignacio E. Grossmann</i>	1043
CO ₂ as feedstock: A new pathway to syngas <i>Flavio Manenti</i>	1049

Design and optimization of intensified non-sharp distillation configurations	
<i>C. E. Torres Ortega, K. Stricker, M. Errico, B.-G. Rong</i>	1055
Deterministic global optimization of multistage melt crystallization processes in hydroformylation	
<i>Christian Kunde, Achim Kienle</i>	1061
Design and economic evaluation of alternatives to effluents treatment on biodiesel production from soybean oil and palm oil	
<i>André F. Young, Fernando L. P. Pessoa, Eduardo M. Queiroz</i>	1067
Synthesis of transcritical ORC-integrated heat exchanger networks for waste heat recovery	
<i>Cheng-Liang Chen, Po-Yi Li, Hui-Chu Chen, Jui-Yuan Lee</i>	1073
Efficiency comparison of different design schemes of reactive distillation process for ethyl lactate production from fermentation-derived magnesium lactate	
<i>Boonpradab Dangpradab, Panarat Rattanaphanee</i>	1079
Tailor-made green diesel blends design using a decomposition-based computer-aided approach	
<i>Li Yee Phoon, Haslenda Hashim, Ramli Mat, Azizul Azri Mustaffa</i>	1085
A mathematical programming targeting method to select treatment technologies ahead of design	
<i>Athanassios Nikolakopoulos, Antonis Kokossis</i>	1091
Optimal structure synthesis of ternary distillation system	
<i>Hiroshi Takase, Shinji Hasebe</i>	1097
Optimization and analysis of chemical synthesis routes for the production of biofuels	
<i>Douglas Allan, W. Alex Marvin, Srinivas Rangarajan, Prodromos Daoutidis</i>	1103
Design and economic evaluation of coal to synthetic natural gas (SNG) process	
<i>Bor-Yih Yu, I-Lung Chien</i>	1109
Water networks synthesis for industrial parks involving inter-plant allocation	
<i>Lin-lin Liu, Jian Wang, Jian-ping Li, Jian Du, Feng-lin Yang</i>	1115
Energy-saving design and control of a hybrid extraction/distillation system for the separation of pyridine and water	
<i>Yi-Chun Chen, I-Lung Chien</i>	1121
Alternative hybrid liquid-liquid and distillation sequences for the biobutanol separation	
<i>M. Errico, E. Sanchez-Ramirez, J. J. Quiroz-Ramírez, J. G. Segovia-Hernández, B.-G. Rong</i>	1127

Integrated product and process design for the optimization of mayonnaise creaminess <i>Arend Dubbelboer, Jo Janssen, Ardjan Krijgsman, Edwin Zondervan, Jan Meuldijk</i>	1133
Synthesis of indirect work exchanger network based on transshipment model <i>Jian Du, Yu Zhuang, Lin-lin Liu, Ji-long Li, Jie Fan, Qing-wei Meng</i>	1139
Development of sustainable CO ₂ conversion processes for the methanol production <i>Kosan Roh, Tuan B. H. Nguyen, Uthaiporn Suriyapraphadilok, Jay H. Lee, Rafiqul Gani</i>	1145
Optimal design of algae biorefinery processing networks for the production of protein, ethanol and biodiesel <i>Peam Cheali, Anthony Vivion, Krist V. Gernaey, Gürkan Sin</i>	1151
Synthetic methane from CO ₂ : Dynamic optimization of the Sabatier process for power-to-gas applications <i>Ali El Sibai, Liisa Rihko-Struckmann, Kai Sundmacher</i>	1157
Inter-process heat integration by coordination among agent systems for heat exchanger network design <i>Naoki KIMURA, Tetsuo KAYA, Shintaro MIYAMOTO, Yoshifumi TSUGE</i>	1163
Design and synthesis of batch processing plants: A consideration of utility aspect and using a robust scheduling platform <i>Esmael R. Seid, Thokozani Majazi</i>	1169
A novel approach for the identification of economic opportunities within the framework of a biorefinery <i>A. I. Torres, I. Cybulska, C. J. Fang, M. H. Thomsen, J. E. Schmidt, G. Stephanopoulos</i>	1175
Integrated design and control of semicontinuous processes using mixed integer nonlinear dynamic optimization <i>Vida Meidanshahi, Thomas A. Adams II</i>	1181
A computational platform for simulation, design and analysis of a poly(lactic) acid production process from different <i>lignocellulosic</i> raw materials <i>Eduardo S. Pérez-Cisneros, Lourdes Avilés-Cabrera, Verónica Medina-Bañuelos, Mauricio Sales-Cruz, Alberto Ochoa-Tapia, Tomás Viveros-García, Ricardo Lobo-Ohemichen</i>	1187
Simultaneous design of desalination plants and distribution water network <i>Sebastián Herrera, Luis A. Cisternas, Edelmira D. Gálvez</i>	1193

Optimal design of microfluidic platforms for diffusion-based PCR for “one-pot” analysis of cells <i>Jordan Crow, Luke E. K. Achenie, Chang Lu, Sai Ma, Despina Nelie Loufakis, Zhenning Cao, Yiwen Chang</i>	1199
A systematic methodology for optimal mixture design in an integrated biorefinery <i>Lik Yin Ng, Viknesh Adniappan, Nishanth G. Chemmangattuvalappil, Denny K. S. Ng</i>	1205
A systematic visual approach to ionic liquid design for carbon dioxide capture <i>Fah Keen Chong, Nishanth G. Chemmangattuvalappil, Dominic C. Y. Foo, Mert Atilhan, Fadwa T. Eljack</i>	1211
Intensification of C5 separation process by heat integration and thermal coupling <i>Hsiao-Ching Hsu, San-Jang Wang, John Di-Yi Ou, David Shan Hill Wong</i>	1217
Conceptual design of post-combustion CO ₂ capture processes - packed columns and membrane technologies <i>Mathias Leimbrink, Anna-Katharina Kunze, David Hellmann, Andrzej Górak, Mirko Skiborowski</i>	1223
Natural gas to liquid transportation fuels and olefins (GTL+C2_C4) <i>Onur Onel, Alexander M. Niziolek, Christodoulos A. Floudas</i>	1229
Life-cycle assessment principles for the integrated product and process design of polymers from CO ₂ <i>Niklas von der Assen, Mathias Lampe, Leonard Müller, André Bardow</i>	1235
Optimization-based methodology for wastewater treatment plant synthesis – a full scale retrofitting case study <i>Hande Bozkurt, Krist V. Gernaey, Gürkan Sin</i>	1241
An integrated framework for controllability assessment and solvent selection in post-combustion CO ₂ capture processes <i>Theodoros Damartzis, Athanasios I. Papadopoulos, Panos Seferlis</i>	1247
Using product driven process synthesis in the biorefinery <i>Alexandra Kiskini, Edwin Zondervan, Peter Wierenga, Edwin Poiesz, Harry Gruppen</i>	1253
Integrating expanders into sub-ambient heat exchanger networks <i>Chao Fu, Truls Gundersen</i>	1259
Water free XTL processes: is it possible and at what cost? <i>Xinying Liu, Bilal Patel, Diane Hildebrandt</i>	1265

Energy and yield evaluation of an alcohols and hydrocarbons production plant using Rh-based catalysts with different promoters <i>Júlio C. C. Miranda, Gustavo H. S. F. Ponce, Harvey Arellano-Garcia, Rubens Maciel F., Maria R. Wolf M.</i>	1271
Computer-aided process analysis of an integrated biodiesel processes incorporating reactive distillation and organic solvent nanofiltration <i>Kathrin Werth, Kolja Neumann, Mirko Skiborowski</i>	1277
A thermodynamic targeting approach for the synthesis of sustainable biorefineries <i>Bilal Patel</i>	1283
A sustainability driven methodology for process synthesis in agro-food industry <i>Jochem Jonkman, Jacqueline M. Bloemhof, Jack G. A. J. van der Vorst, Albert van der Padt</i>	1289
Evaluation of dimethyl carbonate and ethylene glycol production from biomass <i>Chayanit Choomwattana, Aksornchan Chaianong, Worapon Kiatkittipong, Pichayapan Kongpanna, Suttichai Assabumrungrat</i>	1295
Simulation of carbon-dioxide-capture process using aqueous ammonia <i>Akrawin Jongpitisub, Kitipat Siemanond, Amr Henni</i>	1301
Energy efficient bioethanol purification by heat pump assisted extractive distillation <i>Anton A. Kiss, Hao Luo, Costin Sorin Bildea</i>	1307
Process design of a multi-product lignocellulosic biorefinery <i>Aristide Giuliano, Massimo Poletto, Diego Barletta</i>	1313
MINLP optimization model for water/wastewater networks with multiple contaminants <i>Kittichai Pungthong, Kitipat Siemanond</i>	1319
Design of separation processes with ionic liquids <i>Worawit Peng-noo, Kusuma Kulajanpeng, Rafiqul Gani, Uthaiporn Suriyapraphadilok</i>	1325
Systematic screening of fermentation products as future platform chemicals for biofuels <i>Kristen Ulonska, Birgitta E. Ebert, Lars M. Blank, Alexander Mitsos, Jörn Viell</i>	1331
From fed-batch to continuous enzymatic biodiesel production <i>Jason Price, Mathias Nordblad, John M. Woodley, Jakob K. Huusom</i>	1337
Feed flexibility of CH ₄ combined reforming for methanol production <i>Benjamín Cañete, Nélide B. Brignole, Carlos E. Gigola</i>	1343

Process alternatives for second generation ethanol production from sugarcane bagasse <i>Felipe F. Furlan, Roberto C. Giordano, Caliane B. B. Costa, Argimiro R. Secchi, John M. Woodley</i>	1349
Simulation study of heat transfer enhancement due to wall boiling condition in a microchannel reactor block for Fischer-Tropsch synthesis <i>Krishnadash S. Kshetrimayum, Park Seongho, Jong Ikhwan, Na Jonggeol, Han Chonghun</i>	1355
CO ₂ vs biomass: Identification of environmentally beneficial processes for platform chemicals from renewable carbon sources <i>André Sternberg, Holger Teichgräber, Philip Voll, André Bardow</i>	1361
Design and optimization of intensified quaternary Petlyuk configuration <i>Massimiliano Errico, Pietro Pirellas, Ben-Guang Rong, Juan Gabriel Segovia-Hernández</i>	1367
Techno-economic analysis of power and hydrogen co-production by an IGCC plant with CO ₂ capture based on membrane technology <i>Daniele Sofia, Aristide Giuliano, Massimo Poletto, Diego Barletta</i>	1373
Synthesis of water treatment processes using mixed integer programming <i>Mariya N. Koleva, Eleftheria M. Polykarpou, Songsong Liu, Craig A. Styan, Lazaros G. Papageorgiou</i>	1379

Abstract

From its first introduction in 1965, the Petlyuk column received a high interest in the research community. Applied for the separation of three-component mixtures, the Petlyuk column is able to perform the separation with a reduced number of equipment and with a consistent reduction of the energy consumption compared to the classical sequences with simple columns. For a three-component separation the Petlyuk arrangement is composed by a prefractionator fully coupled with a main column that performs the separation of the products. Considering the great potential of these sequences it is natural to think about a possible extension to more than three component separations. In the present work a four component case is examined. If the divided wall column configuration is considered, the presence of three walls inside the main column makes the design and the control too complex to attract the industrial interest for a real application. New intensified sequences were proposed for the separation of four-component mixtures. These configurations use a less number of columns compared to the Petlyuk configuration. The case study reported proves the potential of the alternative configurations.

Keywords: Petlyuk configuration, distillation sequencing, design, energy saving.

1. Introduction

Two milestones are recognized by the research community as meaningful improvements in separations performed by distillation. The former is the introduction of structures with a partition wall inside the shell and the latter can be considered the definition of the Petlyuk configuration. Both of them were introduced almost fifty years ago but only recently have been successfully applied into the industrial practice for a limited number of feed components. Considering three-component separations, the Petlyuk configuration is composed by a prefractionator connected by two thermal couplings to the main column where the three products are obtained. If the prefractionator is included in the main column, the corresponding divided wall column (DWC) configuration is obtained. In both cases only one condenser and one reboiler are employed. It was clearly demonstrated that for a three-component mixture the Petlyuk configuration can

save up to 30 % of the energy consumption compare to the classical separation sequences (Emtir et al, 1999). Despite this evidence at least three valid hurdles contributed in the late development of Petlyuk and DWC configurations in the industrial practice. The first is the absence of recognized design methods, the second is the complexity of the structure and the third reason is the difficult in the process control. The research efforts, focused around these three points, contributed to reach more than one hundred operative DWCs around the world.

It is possible to assert that for the case of three component separations the Petlyuk and its equivalent DWC configuration has the potential of a noteworthy energy saving, different design methods are available, structure complexity are overcome by using the thermodynamically equivalent configurations and moreover the control issues are solved. It is clear that the same results are aimed for different number of feed components. Moving from three to four components the complexity of the Petlyuk and DWC structure increases and up to now only few studies are focused on the possible applications of these configurations. The aim of the present work is to propose alternative configurations to the Petlyuk/DWC configuration for a four-component separation. The benefit of the alternatives proposed is a simple design with a less or comparable total annual cost compare to the corresponding Petlyuk/DWC configuration. A case study is presented to support the new sequences.

2. Synthesis Procedure

The synthesis procedure is a systematic methodology that allows the prediction of all the alternatives generable from a sequence chosen as a reference. For a four-component mixture, the non-sharp configuration reported in Figure 1 is considered to start the generation procedure.

Figure 1. The six-column sequence for the fully sloppy separation of a quaternary mixture.

In this six-column sequence, usually referred as fully sloppy configuration, all the mixtures with three or more components are separated by symmetric sloppy splits. The corresponding Petlyuk configuration can be obtained in two steps: in the first one the

column sections where the same mixture or component is separated are merged. In the case considered sections 4 and 5, 8 and 9, 10 and 11 are combined reducing the number of column to three. Then, considering that in the Petlyuk configuration there is only one condenser and one reboiler independently from the number of component to be separated, all the condensers and reboilers associated to non-product streams can be substituted with a thermal coupling. The corresponding configuration is showed in Figure 2.

Figure 2: quaternary Petlyuk configuration

The Petlyuk configuration has three columns and five thermal couplings. Intensified sequences alternative to the Petlyuk arrangement can be obtained starting from the fully sloppy configuration of Figure 1 applying four different strategies (Rong et al., 2014):

1. Closed-Heat-Integration strategy to combine individual columns. This strategy is used to combine two columns by heat integration between a condenser and a reboiler co-producing a same product. This will reduce the number of columns.
2. Thermal coupling strategy to eliminate a condenser or a reboiler. This strategy is used to eliminate a condenser or a reboiler associated to a mixture of two or more components. This will reduce the number of heat exchangers.
3. Rearrangement of column sections strategy to generate thermodynamically equivalent structures. This strategy is used to recombine the column sections in a thermally coupled configuration through movement of the movable column sections. This will generate the thermodynamically equivalent structures which have different columns than the original thermally coupled configuration.
4. Elimination of the single-section-side columns strategy to produce the intensified distillation systems. For a thermally coupled configuration, there are thermodynamically equivalent structures in which there are single-section-side columns. This strategy is used to eliminate the single-section-side columns to generate the intensified distillation systems with fewer columns.

Applying the four point strategy presented the five configurations reported in Figure 3 are obtained. In particular the configuration reported in Figure 3(a) is obtained applying the strategy 1 to merge section 8 with section 9 and section 10 with section 11, then following the strategy 2 the condenser associated to the submixture ABC and the reboiler associated to the submixture BCD are substituted by thermal couplings. Strategy 3 is used to rearrange section 3 above section 1 and section 6 below section 2, finally single sections 4 and 5 are eliminated as indicated in the strategy 4. Similarly the configurations reported in Figure 3 (b-e) are obtained. Analyzing all the configurations generated is possible to notice that are all composed by two columns, moreover in

sequences 3(b) and 3(d) the stream C is obtained twice, in sequences 3(c) and 3(e) the component B is recovered in two separate streams. Only the sequence 3(a) is associated to the minimum number of streams.

Figure 3: The intensified distillation alternatives for quaternary Petlyuk configuration

3. Case Study and Comparison Indexes

To test the applicability of the new intensified sequences, a case study has been considered. The composition and the product purity targets are shown in Table 1.

Table 1: feed composition and purity target

	Component	Feed composition [mol frac.]	Purity target [mol frac.]
A	Butane	0.05	0.990
B	Hexane	0.10	0.970
C	Heptane	0.10	0.974
D	Nonane	0.75	0.997

A saturated liquid feed flowrate of 100 kmol h^{-1} is considered. All the configurations were simulated by means of Aspen Plus V8.0. The NRTL thermodynamic method was used and sieve trays columns were considered. The column pressure was optimized for

each column considering the possibility to use water in the condenser. The minimum temperature for the columns overhead vapor was defined to 323K.

Three different indexes were selected for the configurations comparison: the total annual cost, the thermodynamic efficiency and the carbon dioxide emission. The Total Annual Cost (TAC) is obtained as a sum of the operative and the annualized capital costs as reported in Eq. (1).

$$TAC = \sum \left[\left(\frac{\text{Capital Cost}}{\text{Time of Investment}} \right) + (\text{Operative Costs}) \right] \quad (1)$$

The operative costs were evaluated taking into account the cost of the water and the vapor in the condenser and reboiler respectively. The costs of the auxiliary fluids were obtained from Rev et al., 2001. The capital costs were considered as the sum of the costs of the condensers, reboilers, column shell and trays, evaluated according to the Guthrie's method reported in Turton et al., 2004. A mean investment time of 10 years was used to annualize the capital costs. The second index considered is how efficient the energy is being used. This information is expressed by the thermodynamic efficiency (η) evaluated as reported by Seader et al., 2009 and defined in Eq. (2)

$$\eta = -W_{\min} / (-LW - W_{\min}) \quad (2)$$

where $W_{\min}$ is the minimum work of separation and LW the lost work.

The last index used to compare the different configurations is the carbon dioxide emission (m_{CO_2}) since as a greenhouse gas is directly related to the global warming. The amount of carbon dioxide emitted was evaluated by the Eq. (3) following the method reported by Gadalla et al., 2005:

$$m_{CO_2} = \left(\frac{Q_{FUEL}}{NHV} \right) \left(\frac{\%C}{100} \right) \alpha \quad (3)$$

where Q_{fuel} is the heat generated by the combustion reaction, NHV the net heating value of a fuel with a carbon content of %C and α the ratio of molar masses of CO_2 .

4. Simulations and results

In order to get the design parameters of all the alternative sequences, the fully sloppy configuration of Figure 1 was first simulated using the short-cut method of Underwood-Gilliland-Winn already implemented in Aspen Plus. The parameters obtained were used to initialize the stage-to-stage rigorous method RadFrac. The number of stages, feed location, reflux ratio were then optimized for the minimum energy consumption.

The design of the Petlyuk configuration was performed considering the correspondent among the column sections functionality (Errico et al., 2014). In this way once the design of the fully sloppy configuration of Figure 1 was obtained the configuration parameters were transposed to the analogous sections. The thermal coupling the flowrates were defined as the minimum possible value to assure the products purity targets. Following the same design methodology cited for the Petlyuk configuration, the alternative configurations reported in Figure 3 have been simulated using the correspondence of column functionality. Only the results for the configuration of Figure 3(a) are reported in Table 2 since, for the composition cases considered, was most convenient from the energy consumption point of view. Among all the alternatives predicted, the one in Figure 3(a), is the only sequence that performs the separation of the middle components once.

Table 2: Sequences comparison

	Petlyuk	Fig. 3(a)
TAC [\$ /y]	433	432
η [%]	47	52
CO ₂ [kg/h]	601	598

5. Conclusions

The work presented a new space of alternatives to the Petlyuk configuration for quaternary separation. The motivation of the work starts from the interest in the Petlyuk configuration due to its potential in energy reduction. Anyway for a four-component separation, the complexity of the design and control limit its application. A synthesis methodology is presented to generate a complete space of alternatives with a simpler design. For the case considered, among all the sequences it was obtained once with similar or better performance compare to the Petlyuk configuration. It is possible to conclude that the alternatives proposed are a valid alternative to the complexity of the Petlyuk configuration but still with the same benefit of less energy consumption.
